## SERISS Experiment for Testing Close versus More Adaptive Questionnaire Translation Approaches: First Results from the Translation Sessions and from the Field (*Work in progress*)

Brita Dorer, GESIS (Mannheim – Germany)  
Lydia Repke, GESIS (Mannheim – Germany)  
Ana Villar (London)

CSDI, Limerick, 26 March 2018

This project has received funding from the *European Union's Horizon 2020* research and innovation programme under grant agreement No 654221.

---

# Overview

- Background: close versus adaptive translation
- Background: Research goals / research design
- Translations & first findings (qualitative)
- Measurement approach (quantitative)

## 1. Background

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 654221.

## **Dilemma: close vs. adaptive translation**

- Most surveys: “Ask-the-same-question (ASQ)”
- No definition of what ‘same question’ means
- Researchers make different interpretations
  - ‘As close as possible’ at the word level
  - Others focus on making stimulus functionally equivalent and believe this requires adaptation
- No empirical evidence yet on which interpretation leads to more comparable data

## Deciding level of closeness: example

How much of the electricity used in [country] should be generated from each energy source?

Energy sources: Coal, Natural gas, Hydroelectric power, Nuclear power, Solar power, Wind power, Biomass

- ☐ A very large amount
- ☐ A large amount
- ☐ A medium amount
- ☐ A small amount
- ☐ None at all

## Deciding level of closeness: example (cont'd)

- Advance translation and translation verification suggested in most languages 'amount'  
→ share / portion / part
- BUT portion posed limitations on the answers:  
you can't have a very large portion of all energy sources
- TEP: Natural language use vs. safe translation?
- Which version yields most comparable data?

## 2. Research goals / Research design

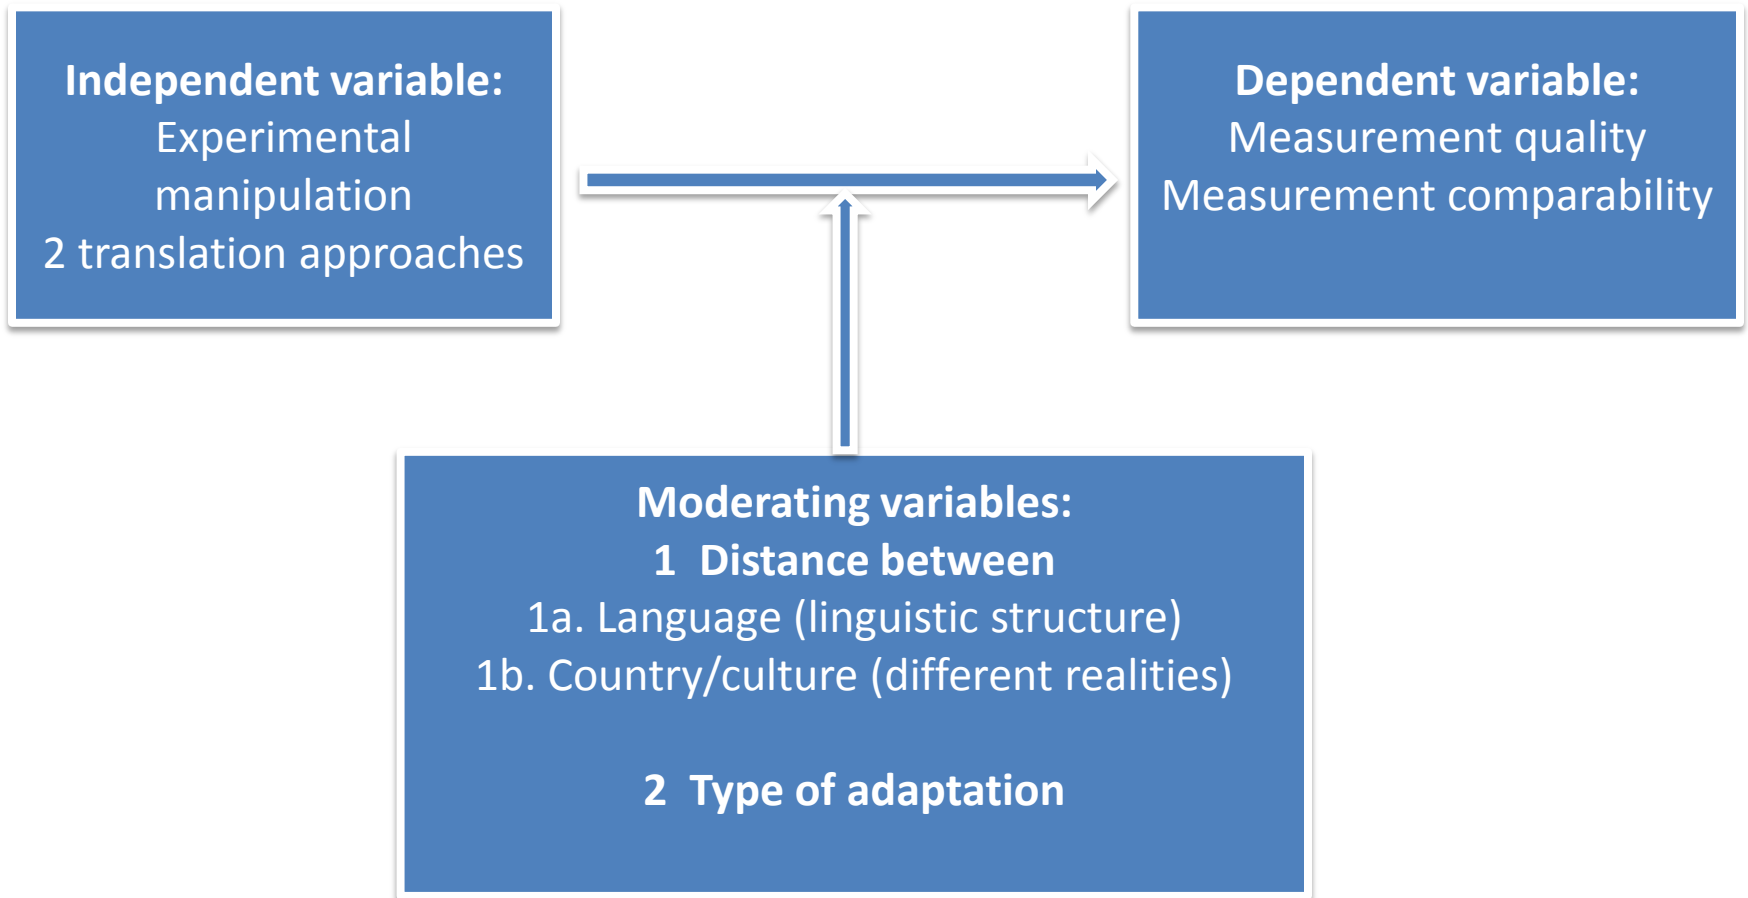

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 654221.

## Research goals / questions

- What to do when "dilemmas" come up?
- Which approach is better: 'as close as possible' vs. 'encouraging adaptation'
  - Better = yielding more comparable data
- Under which conditions is that approach better?  
Does the effect differ by...
  - Language: are some languages more resilient to close translations than others?
  - Type of adaptation: factual, linguistic...
  - Degree of adaptation: are some adaptations "too much"?

# Overall model

# Research design

- 2 sets of instructions produced: close vs adapted
- 2 languages: Slovene (SL) & Estonian (ET)
- For each language 3 teams and 3 sets of items:
  - 2 parallel Translations following experimental instructions
  - Review / Adjudication meeting with instructions present
- Manipulation checks
  - Audio taping
  - Follow up interviews with translators
- Data collection: Cross-National Online Survey (CRONOS) panel
  - 60 items

**Close = 'As close as possible'**

**Adapt = 'Encouraging adaptation'**

	<b>Team 1</b>	<b>Team 2</b>	<b>Team 3</b>
<b>Items 1-20</b>	Close	Adapt	Adapt
<b>Items 21-40</b>	Adapt	Close	Adapt
<b>Items 41-60</b>	Close	Adapt	Close

## 3. Insights from the translations

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 654221.

## **Translation sessions: Estonian (ET) and Slovene (SL)**

- Took place in summer 2017
- Team approach (2 translators + 1 reviewer/adjudicator)
- All reviewers experienced in questionnaire translation
- Almost all translators experienced in questionnaire translation
- None of them from ESS, ISSP, SHARE translation teams
- Each team 3 batches
- At least 1 week between the 3 batches
- 2 instructions documents (close – adaptive)
- All Review sessions recorded (audio): Manipulation check

## Findings from translation sessions

- Follow-up interviews with all 6 reviewers (3 ET and 3 SL)
- Follow-up interviews with translators of 3 last teams (2 SL teams + 1 ET team)
- Not everybody realised the difference between the approaches! (1 ET, 1 SL team)
- Most common approach: usually all experienced reviewers translate as close as possible to source (comparability) but adapt where necessary

## Ongoing: qualitative aspects

- Native speakers in ET and SL
- Analyse
  - a) translation templates / final translations
  - b) review sessions (audio recordings)
- WHAT was actually asked, what were the differences
- Combine with qualitative results

## 4. Measurement approaches / insights from the field

This project has received funding from the *European Union's Horizon 2020* research and innovation programme under grant agreement No 654221.

# Analytical strategy

- Dependent on the items
- Possible methods
  - Multigroup Confirmatory Factor Analysis (MGCFA)
  - Item response theory
  - Web probing
  - Questions from benchmark surveys
  - Content analysis of the review meetings: also learn about how instructions worked

# Sample

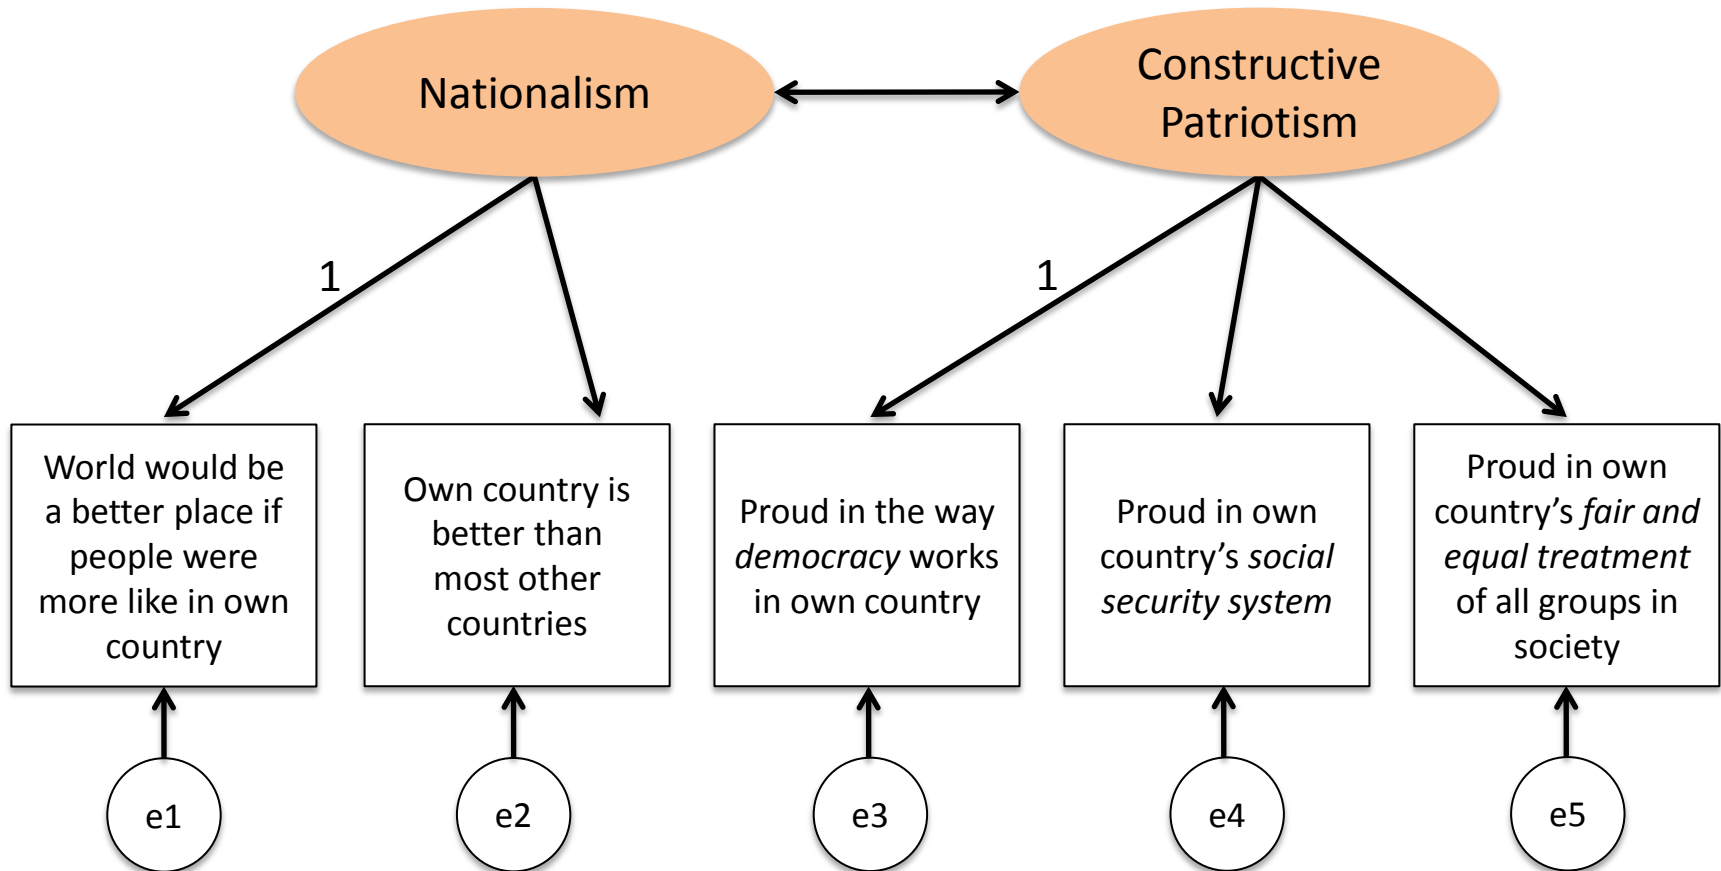

Country/ exp. group	EE	GB	SI	Total
<b>1</b>	173	209	194	576
<b>2</b>	153	223	217	593
<b>3</b>	173	201	204	578
<b>Total</b>	499	633	615	1.747

*Note.* In GB the three experimental groups are the same with respect to the questionnaire.

## Example – National Identity

- 2013 ISSP Module on National Identity
- Dimensions measured by 5 items
  - Nationalism (2 items, 5-point scale)
  - Constructive patriotism (3 items, 4-point scale)
- Method: MGCFA (Davidov, 2009; Meitinger, 2017)
- 7 groups to test for measurement equivalence
  - EE (3 groups)
  - GB (3 “groups”  $\triangleq$  1 group)
  - SI (3 groups)

## Example – National Identity

## Example – National Identity

- Scalar invariance not supported by previous findings (Davidov, 2009)
- Possible problems with terms
  - E.g.: pride, social security system, democracy, all groups of society
  - Pride with how social security system works has been shown to load negatively on nationalism in GB (Davidov, 2009)

## Next steps - Discussion

- Carry out / complete quantitative and qualitative analyses
- Discussion:  
How to test for measurement equivalence for single items?
