# Effects of Field Interviewer Geßßtaokin甲atafrom a Global Household Survey on Tobacco Use 

Jeremy Morton<br>Luhua Zhao<br>Krishna Palipudi

Global Tobacco Control Branch, Office on Smoking and Health U.S. Centers for Disease Control and Prevention

Second International Conference on Survey Methods in Multinat Multiregional and Multicultural Cabiterts (

26 July 2016

## Overview

- Background
- Objective
- Methods
- Results
- Summary of Findings
- Implications

## Background: Interviewer Effects

- "Interviewer Effects in Public Health Surveys" (Da al. 2010*)
- "Interviewer Er'rorariancin estimates due to difference data collected from different interviewers
- "Interviewer Effe"ctsseasurement error attributable to a interviewer characteristic such as race or gender
- Interviewer effects especially occur in public health su measuring topics prone to social desirability
- Little evidence to suggest interviexundent matching improves validity
*DavisR. E. et al. "Interviewer Effects in Public Healthesltthentsication Resear(2010): 14-26. PMC

## Background: Underreporting Smoking

- Widespread belief thvemen from certaégions underreport smokibghaviors because of social desirability
- Smokingy femalescionsidered socially undesirable in parts Asią Middléeast
- Limited evidence
- South Korea Health and Nutrition Examination Survey use Cotinine validation
- 58.9 offemales and $12.1 \%$ of males misclemerifuelves as norsmokers*
- Biomarkersould be gold standard to validatereplfrted tobacco use and measortential misreporting
- Usefulness maylibetted because of cost/burden
*JungChoik. et al. "Hidden female smokers in Asia: a cefnsptnésemtedwith cotininererifiectmoking prevalence; rates in representative nationafroatanAsian populationflealth Education Reseazezonon): 14-26. PMC

## Study Objective

- Examine relationship between interviewer gende selfreportedmokingtatus ia global survey on tobacco use
- Hypotheses:
- Femalœspondents will report significantly different prevalenaffsmoking to female interviewers than to ma interviewers
- No differences in prevalence of smoking among male respondents, by interviewer gender

## Methods: Global Adult Tobacco Survey

- Global surveillance systemcioitoring adult tobacco us and tracking key tobacco control indicators
- Smokingsmokeless, cessation, exposure to secondhand si economics, media, knowledge \& attitudes
- Nationallyepresentativepierson househslarvey of persons 15 years of agler
- Standarquestionnaire, sample design, data collectior managemerprocedures
- In-country partners/agencies implement GATS
- CDC/WHO/partnerrsvideonsultation to ensure standardization/quality

## Methods: Global Adult Tobacco Survey

- Interviewer administered using haredtmepduters
- GATS standard design: roster all eligible household $m$ and select 1 to complete the tobacco survey
- Optional design feature: Gender Randomization
- Randomly prdesignate sampled households as male or fema
- Roster only eligible males or females
- Primarily used for cultural reasons, where interspendent gender matching is required

## Methods: Analysis

- Included 4 Asian countries where gender matching was used and data were available on field interviewer (FI) ge
- China 2010 (East Asia): $\mathrm{n}=13,354$; response rate (RR)=96.0\%
- Kazakhstan 2014 (Central Asia): n=4,425; RR=96.7\%
- Malaysia011 (Southe ásilà: $n=4,250$; RR=85.3\%
- Vietnam 2010 (Southeast Asia): n=9,925; RR=92.7\%
- Examined results of smoking prevalence among males/f by FI gender
- Among females: analyzed by age, urbanicity, education
- Weighted prevalence estimates were reported
- Z-test with twbailed hypothesis (significance p < .05)

## Results

Current Toba@uookingrevalence Amolmigles15 yearmid, by Interviewer Gendrats 202014

|  | All males (regardlesf interviewer gender) | Intervieweßender |  | Z-score, ypalue |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Male | Female |  |
| China 2010 | 52.9\% | 53.9\% | 51.9\% | $\mathrm{Z}=0.87, \mathrm{p}=.38$ |
| Kazakhstan 20 | 42.4\% | 40.2\% | 44.0\% | $\mathrm{Z}=1.25, \mathrm{p}=.21$ |
| Malaysia 2011 | 44.1\% | 46.8\% | 40.6\% | $\mathrm{Z}=1.92, \mathrm{p}=.05$ |

## Summary of Findings

- No significant differences among males in reporting smoking to male and female FIs
- Marginally nesignificant difference in Malaysia
- Significant differences among females in reporting sr to male and female Fls in two countries:
- Kazakhstan: Higher overall prevalence reported to female
- Malaysia: Higher overall prevalence reported to male Fls
- Significant differences among subgroups (for female
- China: 464 year olds, low education
- Kazakhstan: 25+, urban, higher education
- Malaysia: 65+, urban, low education
- No differences found among Vietnamese women

## Discussion

- There was evidence of interviewer effects as fem respondents may have underreported their smok behavior in 2 out of 4 countries
- Underreportintey females magtentially lead underestimation of overall smoking/tabseco
- Accurately monitoring smoking among females is critical to effectively implement population based tobacco control strategies that lower tobacco

## Implications for Future

- On a case-case basis, countries may want to consider usingre\$pondent gender matching fo validity concerns (not just cultural requirement
- May be a need to match opposite genders for fem
- Future research
- Subgroup analysis among males
- Analyze additional countries
- Explore possibility of rhertèl modeling to control for Fl effects (suggested by Davis et al. 2010)

## Thank you for your time
